1. INTRODUCTION

- Many young English-speaking children make verb-marking errors in their speech such as using:
 - the bare form of the verb when an inflected form is required.
e.g., "Baby cry" instead of "Baby cries"
 - the progressive participle when an auxiliary and progressive combination is required.
e.g., "Baby crying" instead of "Baby is crying"
- The **Competing Sources of Input (CSI)** account proposes that verb-marking errors reflect the extraction of bare form sequences from longer structures in the input.
e.g., "Baby cry" from "Does baby cry?" or "Baby crying" from "I can hear the baby crying"
- Children use these bare form sequences in contexts in which the inflected form is required.
e.g., producing "This baby cry" or "The baby crying there"
- However, apparent support for this account^{1,2} can be explained by effects of bare form verbs alone.

AIMS

We use two pre-registered corpus analyses to investigate:

Study 1 → Whether there are sequence effects on children's verb-marking errors and whether these effects occur over and above verb effects which are already well established in the literature^{3,4}.

Study 2 → How these effects change over development.

Pre-registrations:
Study 1: <http://osf.io/ef8bm>
Study 2: <http://osf.io/rx43n>

2. METHODS

Procedure

Stage 1

Child Corpora

Study 1 → Manchester Corpus⁵:
12 children between 2 and 3 years old.
N = 4592 3sg Utterances

Data from Study 1 +
Study 2 → Post-Manchester Corpus^{6,7}:
12 children between 3 and 4 years old.
N = 9263 3sg Utterances

Child-Directed Speech Corpora

English (UK & USA) subsections of CHILDES⁸

All corpora (**N = 32**) were of naturalistic speech between typically developing children and their caregivers.

Stage 2

Utterances were coded for error:

1 = Error (where the bare form was produced instead of the inflected form)
e.g., **Baby cry**

0 = Correct (where the correctly inflected form was produced)
e.g., **Baby cries**

NA = Exclude (e.g., where the bare form was produced correctly)
e.g., **Why does baby cry?**

*CHI: does [/] does your baby go in the bath ? NA	
*CHI: because he gets lost sometimes .	0
*CHI: he want get some fire .	1
CHI: where [] that other one go ?	NA
CHI: where [Odoes] a baby cow goes [*] ?	NA
*CHI: teddy likes to play with it .	0
*CHI: sometimes it fits in to this .	0
*CHI: and Nana want sit in the front .	1
CHI: it need [Oes] some those .	1

Stage 3

Subject-Verb Sequence Bias:
Frequency of a bare form subject-verb sequence (e.g., "Baby cry" in "Does baby cry?")
Vs
Frequency of an inflected subject-verb sequence (e.g., "Baby cries" in "The baby cries")

Verb (in 3sg contexts) Bias:
Frequency of a bare form verb in any 3sg context (e.g., "Cry" in "Baby/Mummy/He cry" etc.)
Vs
Frequency of an inflected verb in any 3sg context (e.g., "Cries" in "Baby/Mummy/He cries" etc.)

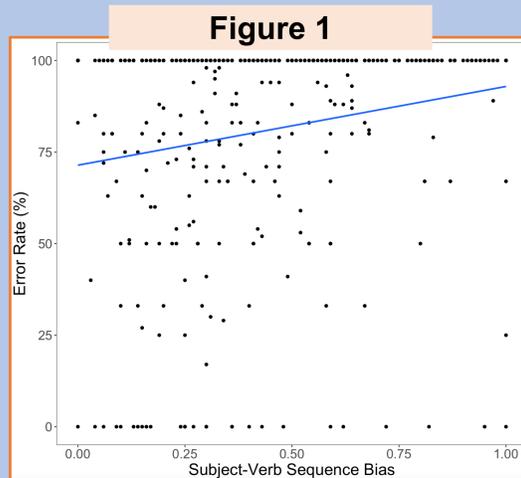

Verb (in any context) Bias:
Frequency of a bare form verb in any context (e.g., "Cry" in "I/You/We cry" etc.)
Vs
Frequency of an inflected verb in any context (e.g., "Cries" in "Baby/Who Cries" etc.)

All bias statistics ranged from **0** (fully biased towards inflected form) to **1** (fully biased towards bare form)

3. RESULTS

Study 1

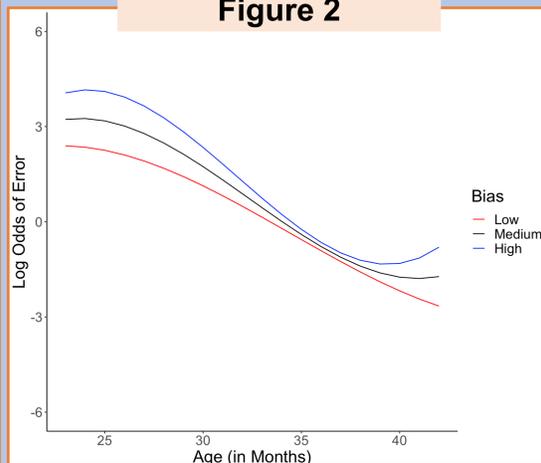

- All 3 bias statistics significantly predicted verb-marking errors.
- High bias = more errors.
- Best predictor = subject-verb sequence bias (see Figure 1).
- Subject-verb sequence bias accounted for significant unique variance = occurred over and above verb effects.

Study 2

- Subject-verb sequence bias = only consistent effect across both age groups.
- Verb bias = not predictive in the older group.
- Effect of subject-verb sequence bias grew weaker over time (see Figure 2).
- This suggests that children recover from making verb-marking errors by becoming progressively more sensitive to context.

Figure 2

4. CONCLUSION

- We found strong evidence for input effects on children's verb-marking errors and evidence for sequence-specific effects directly supporting the CSI account.
- The developmental pattern is consistent with the idea that children can recover from verb-marking errors by becoming more sensitive to context, at first just immediate contexts (e.g., "Baby" in "Does baby cry?") and eventually more distant contexts (e.g., "Does").
- An interesting avenue for future research is to investigate sequence effects in other languages e.g.,
 - Spanish agreement errors (e.g., "Mama y Papa quiere" from 3sg sequences like "Papa quiere")
 - Dutch Optional Infinitive errors (e.g., "Dolly dansen" from modal questions like "Kan Dolly dansen?")
